

CSE 114 Intro to OOP

Lab 2-Apr-2026

Lab Exercises

These exercises involve TicTacLab.java

1. As written, TicTacLab does not validate user input at all. It will crash if you enter text instead of a number. It doesn't check that the number is between 1 and 9. Modify the program so that it enforces that the user must enter a number between 1 and 9.

2. (Harder) Write the function

```
public static boolean checkWin(char [] [] board, char c)
```

The function should return true if the argument char *c* has a winning position: three in a row, either horizontal, vertical, or diagonal.

3. (Hardest) Modify the program so that the computer plays for *X* (or for *O*), or gives the user the choice of whether to be *X* or *O*.
