

1. Our TestBases.java file tests the functions toBase() and strToInt(). For a lab, you wrote new versions of the string conversion functions binToOct(), binToHex(), octToBin() and hexToBin(). We have also posted solutions to that lab.

Extend TestBases.java so that it includes automated tests for these four string conversion functions.

2. In another lab, you completed the tic-tac-toe game checkWin() function in TicTacLab.java. We have also posted a solution. Automate testing of the checkWin() function.
3. If you have time, try writing timing benchmarks for the sorting functions selectionSort() and insertionSort() and test them on large random arrays, where the array size can be specified on the command line. Try testing them on large arrays that are almost sorted to begin with (create a sorted array then swap some random elements).
